Introduction

The Appendix to the Wealth Inequality Trends section of the GC Wealth Project provides additional information on the

In particular, this appendix provides

- the full list of sources covered by the GC Wealth Project Wealth Inequality Trends Database
- source-specific information on raw data source, all source-specific composition tables reporting all composition rules used to obtain the wealth concepts, and additional tables on conceptual and manual mapping,
- source-specific information of the GC Wealth Project Wealth Inequality Database in terms of
- additional source-specific documentation and information on the estimation method in case of sources for which we estimated wealth inequality measures ourselves and an explanation of the inclusion and exclusion of data points in the case of sources that (also) provide fully imputed wealth inequality estimates
- country-specific information on the coverage of the GC Wealth Project Wealth Inequality Trends Database in terms of the time span, number of observations and the types of variables by source.

Source-Specific Documentation

In case of the Wealth Inequality Trends database of the GC Wealth Project, the **Methodological Tables** provide a detailed documentation of each **source**, thus the primary source-specific documentation is provided in these tables. In this appendix., we summarize the most important aspects for two types of sources: *i*) sources for which we estimated measures of wealth inequality based on microdata (Household Finance and Consumption Network [2021](#); LIS [2022](#)), and *ii*) sources where we could not cover the full range of estimates available in the raw data of source, especially because data points provided by the source are fully imputed (Credit Suisse [2022](#); World Inequality Database [2022](#)).

Household Finance and Consumption Survey (HFCS_ineq)

We have estimated wealth inequality using three waves of data from the Household Finance and Consumption Survey (Household Finance and Consumption Network [2021](#)). As the HFCS is a multiply imputed data set, we obtained all estimates by applying Rubin’s Rule, that is, they are the mean of the estimates across the five imputates. Second, we have used the household level weights provided in the dataset for the estimations. Third, our estimates rely on the variable `dn3001`, which is net wealth at the household-level. This definition does not encompass private or occupational pension wealth, while private pension wealth is included even if it is not (directly) marketable (at the same value). Fourth, the HFCS is an ex-ante harmonized survey, it is coordinated by the European Central Bank but conducted by the national central banks of the Eurosystem, and all countries survey, in principle, the same concept of net wealth. There are, however, important differences in the precise survey methodologies across countries and the resulting quality of the data, especially in terms of the coverage of the upper tail and the valuation of assets. Thus, while the survey is conceptually harmonized, the country-specific survey designs differ substantially. Some countries use (external) administrative data of different types to attach values to single components of net wealth, especially Finland, Estonia, Ireland, Latvia and Lithuania. While sampling in most countries includes some type of oversampling of the upper

tail, others do not even attempt to counterbalance the higher non-response rate at the top (Austria, Italy, Netherlands, Malta, and Slovenia). For the countries with over-sampling strategies, the precise procedure varies and is based on either individual, household, or region-specific estimates of wealth or wealth correlates. In summary, the effective oversampling rates of the top 5 percent ranges from -15% (Austria) to 413% (Spain) in the last wave of the survey according to Household Finance and Consumption Network (2021). Finally, we work with an identical definition of net wealth that excludes all private and occupational pension wealth. This might hide important aspects in country comparisons in light of (statutory) differences on the (relative) importance of the first, second, and third tier of pensions systems.

The HFCS reports wealth only at the household level, and at the moment our database only covers estimates of wealth inequality referring to the distribution among households.

Luxembourg Wealth Study (LWS_ineq)

The Luxembourg Wealth Study (LWS, LIS (2022)) provides cross-country harmonized micro-data on household wealth. Except for one country, Norway, the data is published via five implicates, and the estimates published in the Wealth Inequality Trends database are thus the average across the five implicates. This difference stems from data for all countries except Norway deriving from survey data. Furthermore, we have used household-level weights in the computation of the wealth inequality measures. Our preferred wealth definition is net wealth including private and pension and life insurance plans (total real assets inclusive of consumer goods such as vehicles and other valuables, plus total financial assets, inclusive of long-term savings via life insurances and voluntary individual pensions plans, minus total liabilities). We were able to implement this concept could for the following countries: Austria, Canada, Chile, Germany, Spain, Estonia, Finland, Greece, Italy after 2000, Luxembourg, Norway, Sweden, South Africa, Slovakia, Slovenia, the United Kingdom, and the United States. For other countries, certain types of assets and liabilities are not available via the Luxembourg Wealth Study (LWS). For instance, valuables are not available for Finland and we thus had to exclude them from the net wealth definition for Finland, while valuables are part of our net wealth definition in all other countries. Given the absence of data, the net wealth concept for the following countries does not include private and occupational pension plans: Australia, Italy up to 2000, Japan, Sweden, and South Africa. We have accessed the Luxembourg Wealth Study to estimate the wealth inequality measures on March 29, 2023.

Word Inequality Database (WID_ineq)

The World Inequality Database World Inequality Database (2022) provides estimates of wealth inequality for most countries of the world. Among these estimates, we have selected those that are consistent with our principle of not being fully imputed wealth inequality data in nature. Our database thus includes estimates that are based on either survey or administrative data on the distribution of wealth for at least one single year. In the case of World Inequality Database (2022), this still implies a very generous coverage as for many European countries with time-series data published on World Inequality Database (2022) the number years for which micro data on the wealth distribution has been used is much smaller than the number of years for which the estimates derive from (backwards) extrapolation.

Furthermore, wealth inequality estimates are available for multiple units of analysis, including equal-split adults (or households). As the set of estimates referring to equal-split adults is the most complete among the sources that qualify for our database, we have chosen these estimates while not reporting statistics referring to other units of analysis. Table 2 lists the countries covered by the GC Wealth Project Wealth Inequality Trends database and, for each country, the primary origin of the distributional data underlying the WID estimates as well as the data type according to our classification, pointing to a substantial methodological heterogeneity underlying. We have downloaded the estimates covered by our database on November 22, 2022.

Table 2: WID_ineq - Countries Covered by GC Wealth Warehouse

Country	Primary Origin	Data Type
Austria	HFCS	Wealth survey and national accounts
Belgium	HFCS	Wealth survey and national accounts
China	Piketty et al. (2019).	Wealth survey (with adjustments)
Cprus	HFCS	Wealth survey and national accounts
Croatia	HFCS	Wealth survey and national accounts
Denmark	Jakobsen et al. (2020); Survey-based estimates for Finland of Blanchet & Martínez-Toledano (2022) are adjusted to align with Jakobsen et al. (2020)	Wealth tax/register data, other sources, and national accounts
Estonia	HFCS	Wealth survey and national accounts
Finland	Blanchet & Martínez-Toledano (2022)	Wealth survey and national accounts
France	Garbinti et al. (2021)	Capital income tax data, wealth survey, and national accounts
Germany	Albers et al. (2022)	Wealth tax/register data, other sources, and national accounts

Norway	Iacono & Palagi (2021)	Wealth tax/register data, other sources, and national accounts
Poland	HFCS	Wealth survey and national accounts
Portugal	HFCS	Wealth survey and national accounts
Russia	Novokmet et al. (2018)	Wealth tax/register data, other sources, and national accounts
Slovakia	HFCS	Wealth survey and national accounts
Slovenia	HFCS	Wealth survey and national accounts
South Africa	Chatterjee et al. (2022)	Wealth tax/register data, other sources, and national accounts
Spain	Martínez-Toledano (2022)	Capital income tax data, other sources and national accounts
Switzerland	Foellmi & Martínez (2017), as estimated by Blanchet & Martínez-Toledano (2022)	Wealth tax/register data, other sources, and national accounts
United Kingdom	Alvaredo et al. (2018); Wealth and Assets Survey 2006 - 2018 as utilized in Blanchet & Martínez-Toledano (2022)	Inheritance/estate tax data, wealth survey and national accounts
United States	Saez & Zucman (2016, 2020b)	Capital income tax data, wealth survey, and national accounts

Credit Suisse Global Wealth Report (CS_ineq)

Credit Suisse (Credit Suisse (2022)) aims at providing estimates of wealth inequality around the global and by country. Generally, the approach of Credit Suisse (2022) is based on combining estimates of per capita aggregate wealth from macroeconomic balance sheets (household sector balance sheets, HBS; and financial balance sheets, FBS) with estimates of the interpersonal distribution of wealth. As, for most countries, no wealth distribution data is available, Credit Suisse (2022) in practice relies on distributional estimates of income inequality instead of wealth inequality for most countries. The approach of Credit Suisse (2022) in summary rests on a large variety of data sources to estimate per capita wealth and wealth distribution,

including survey data on wealth, administrative data on wealth, rich list observations and survey data on income or estimates of income inequality. Following our principle of not covering fully imputed wealth inequality estimates, we can only keep a sub-set of the countries for which Credit Suisse publishes data. The countries we cover are listed in Table 3. Importantly, we also, as in the case of WID_ineq, classify an estimates of not fully imputed even though the distributional information has not been directly obtained from microdata (such as the HFCS micro data) but indirectly via available databases or research papers.

Table 3 shows for each country covered by the GC Wealth Project Wealth Inequality Trends Database the i) data source for the estimate of per capita wealth (HBS and or FBS in column two), the ii) the data source for the estimate of wealth inequality which can be a published research paper or report, a database, official statistics, or microdata in column three, the iii) the reference years of the source providing distributional data, and iv) the reference years of
